

NYC Parks

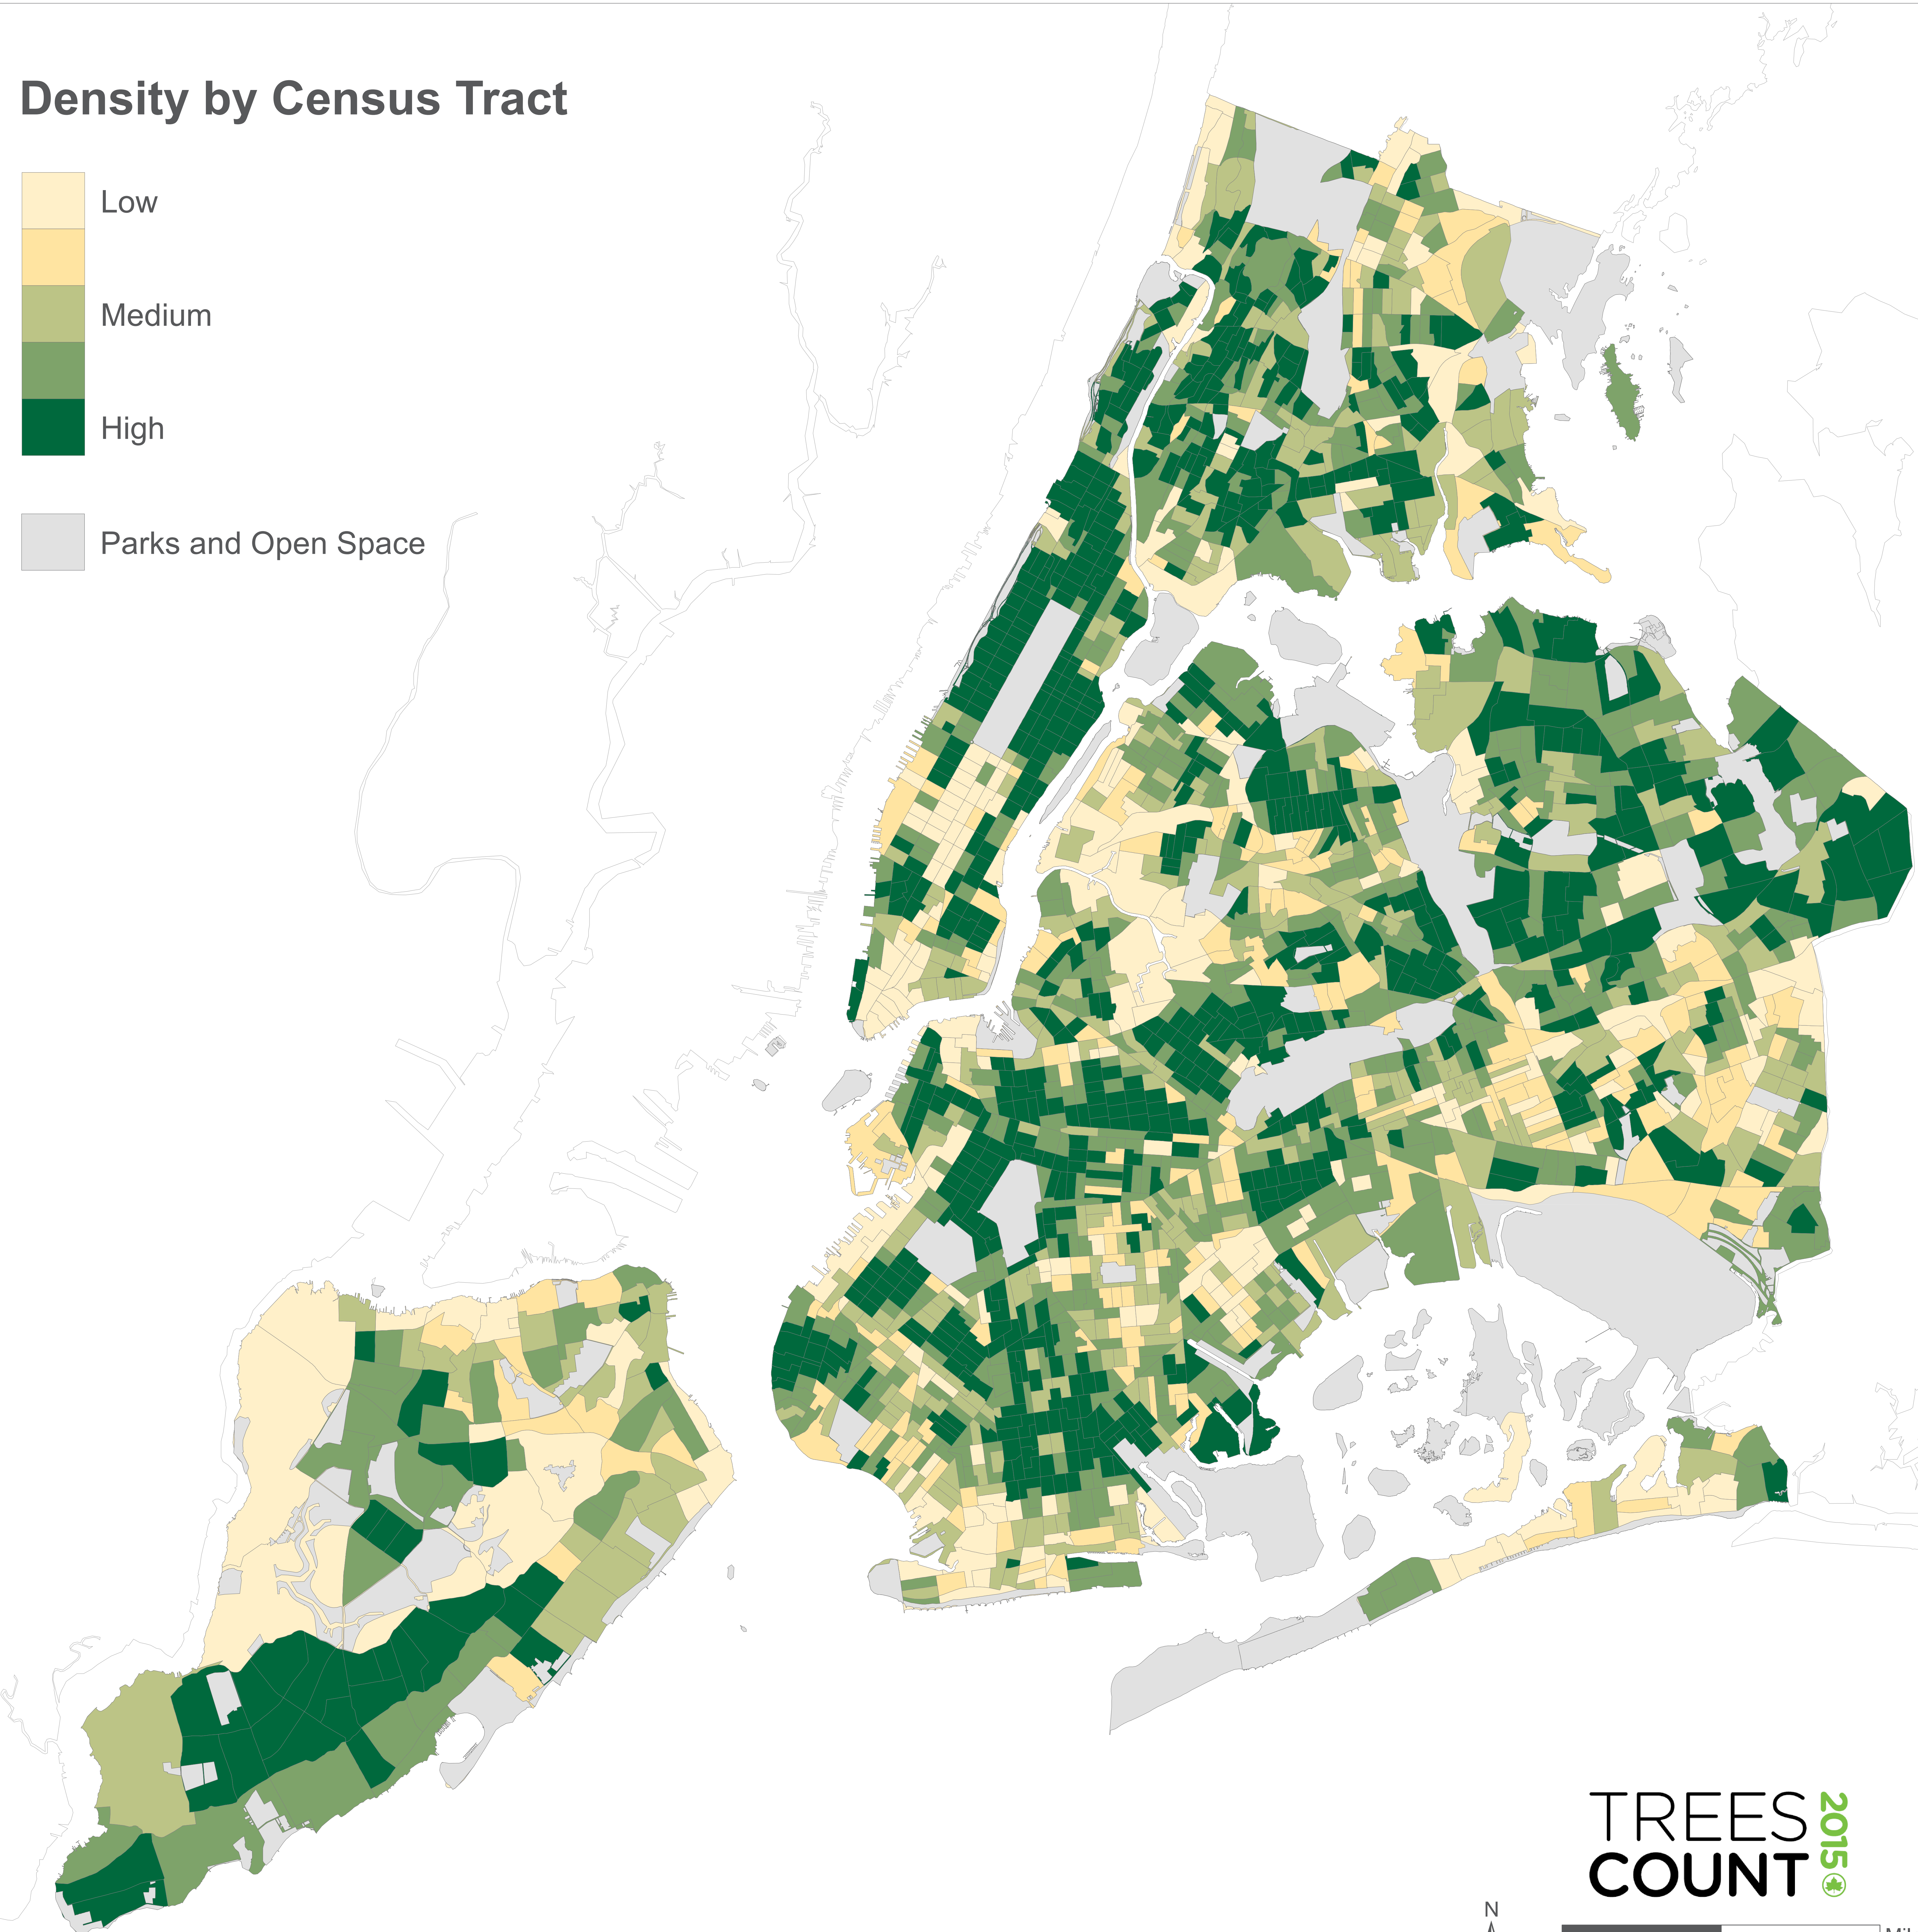

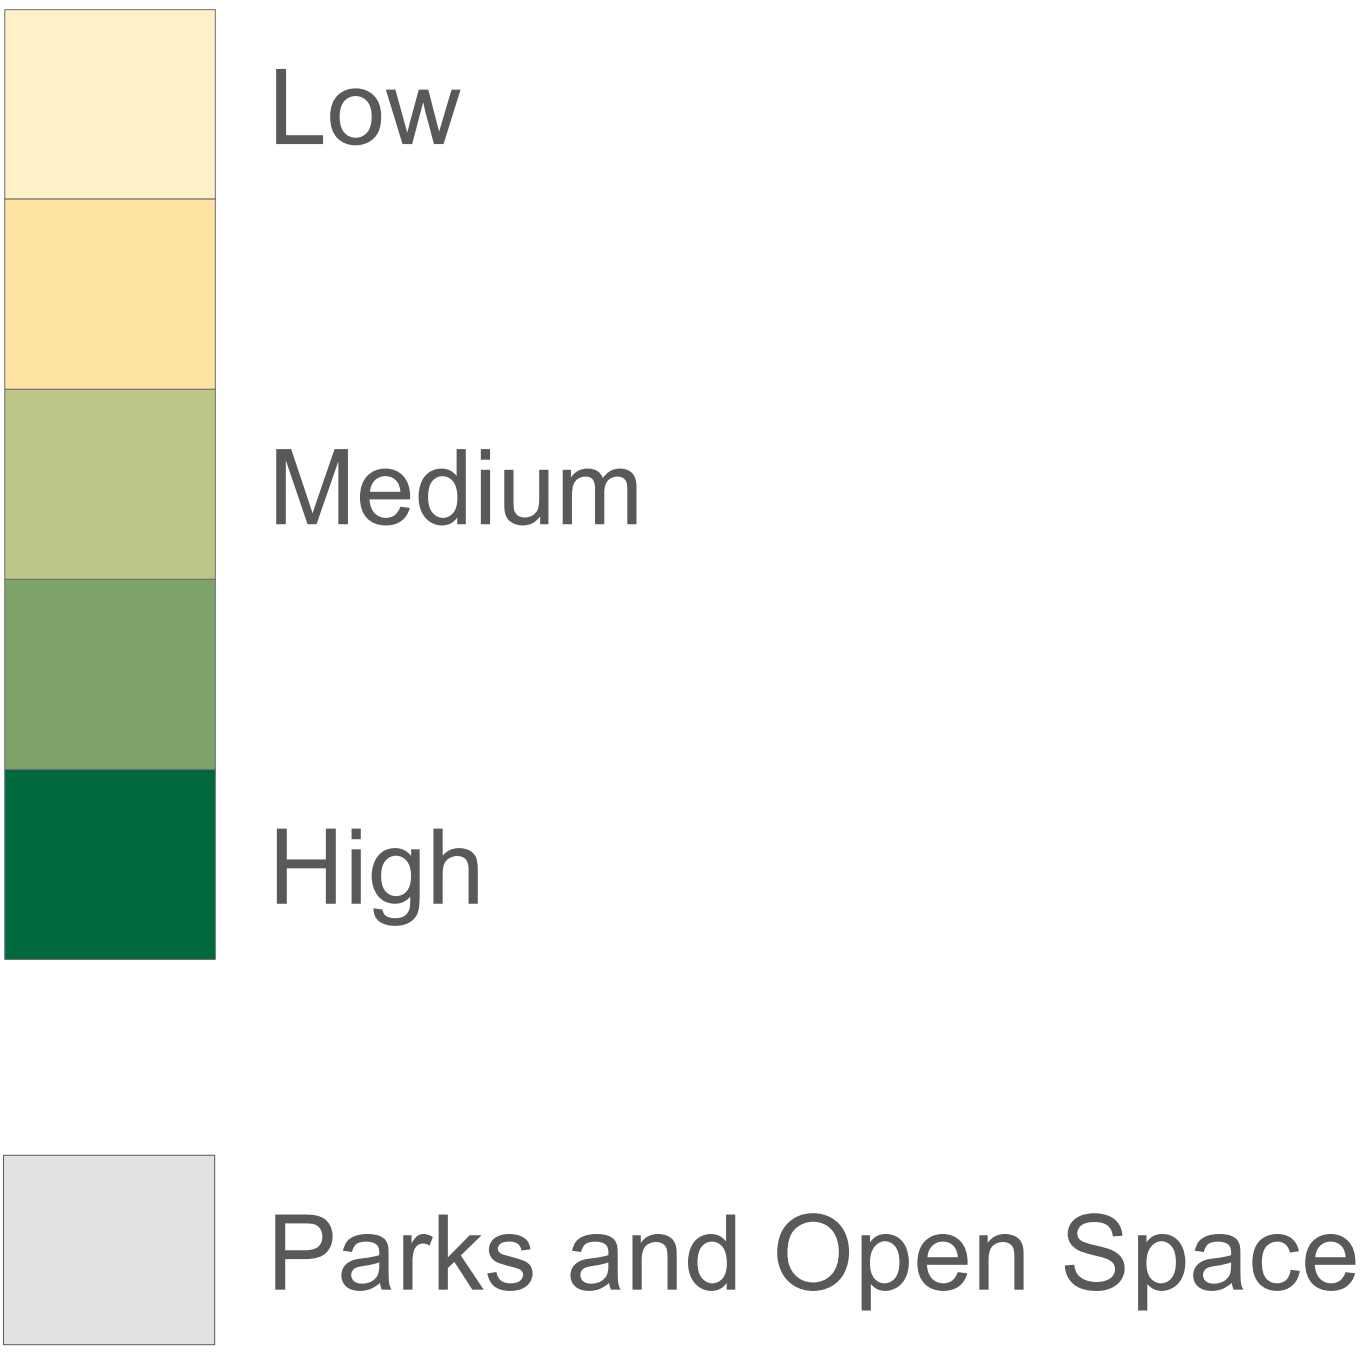

Street Tree Density

How to Read This Map

Each borough on this map is divided by census tracts, a geographic division used by the U.S. Census containing 1,200 - 8,000 people. The tracts are shaded based on the tree density calculated using data collected in the 2015-2016 Trees Count! Street Tree Census.

What does this mean? Street tree density is a measure of the number of trees per foot along NYC streets. Areas with low street tree density are more likely to have significant potential for new tree planting.
